

Data Cleaning (Harikesh Tambareni & Ishika Patel):

Using PostGre SQL, we were able to take the CS6601 anonymized data set and clean the data based on the metrics needed. The things we filtered out included:

- The subject is null and isn't named 'Student Interactions' or 'Search for Teammates!'. We don't want null rows to affect what we find when we look for the answers to our metrics.
- We filtered out these subject lines since there were many lines of these just with student information and no followup by TA or instructor. We found this to be irrelevant to our future goals.
- Where the folder was null and the submission_html_removed is null. The 'submission_html_removed' is the comment section, or the question/answer a student or TA has made on Piazza. We just want to remove as many null rows as possible so they do not affect our calculations later in the semester.
- We also filtered out submission_html_removed that had a character count of less than 20. We assumed that anything under 20 characters would be irrelevant.

Action Items:

1. Can look into separating student-teacher responses/posts

Rohan/ Youngwook

Created metrics to add to the dashboard created in previous semesters. A problem we ran into was identifying whether the posts/responses was a teacher or student. Not being able to identify this cuts down the metrics we can use for the teacher tab of the dashboard.

Some future plans we hope to achieve are creating a model to check the engagement on a specific post or working of our previous sentiment model in order to better group common problems students have had or identify times when a post about a certain topic is trending. This can hopefully provide teachers insight to the big questions that are being asked in the forum.
